

Savannah summers can put heavy demand on air conditioners, and small issues can turn into uncomfortable indoor conditions fast.(Image: <https://s3.amazonaws.com/static.sidebox.com/E125E806-D1D7-4F03-871A-FE33C6AC6D8E/2403067.jpg>) When an AC is not cooling, the cause may be as simple as a clogged filter or as complex as a refrigerant leak, failing capacitor, or airflow restriction. McDevitt Air provides HVAC repair in Savannah with practical troubleshooting designed to find the real issue and restore steady performance.

Many cooling problems start with airflow. Dirty filters, blocked returns, or duct leaks can reduce comfort and raise energy use. A service visit typically includes checking thermostat operation, inspecting electrical components, testing system performance, and looking for refrigerant or drainage problems.(Image: <https://www.gianniniimpianti.com/source/chi-siamo/chi-siamo-1.jpg>) If needed, repairs may include replacing worn parts, correcting airflow restrictions, or sealing ductwork so the system can move air properly.

If equipment is older or breaking down frequently, central air replacement or a new installation can be a better long-term plan. Correct sizing, proper installation, and regular tune-ups support efficiency and comfort. Seasonal maintenance can also reduce surprise failures by catching small issues early, cleaning key components, and confirming safe operation before peak heat.(Image: https://www.cardwellhvacnj.com/wp-content/uploads/photo_2022-09-16-14.57.23.jpeg)
